Anesthesia	■ 45,000.00
Hospital Stay (3 Days)	■ 90,000.00
OT Charges & Consumables	■ 85,000.00
Post-Op Medications & Care	■ 40,000.00
TOTAL ESTIMATED COST	■ 380,000.00

Clinical Justification

The patient, Divya Das, presents with a BMI of 42.8 kg/m², classifying her as morbidly obese. She has a documented history of Type 2 Diabetes and Hypertension, which are poorly controlled. Conservative weight loss attempts (diet, exercise, and pharmacotherapy) over the past 24 months have failed to yield significant results. Bariatric surgery is medically necessary to mitigate life-threatening comorbidities and improve long-term health outcomes as per established clinical guidelines.

Detailed Treatment Planning

- Pre-operative cardiac and pulmonary clearance.
- Laparoscopic Sleeve Gastrectomy under general anesthesia.
- Post-operative pain management and early mobilization.
- Nutritional counseling and liquid diet for 2 weeks post-surgery.
- Follow-up appointments at 1 week, 1 month, and 3 months.
